

Please **AMEND** the claims as follows:

1. (Previously Amended) A method of creating a report having security based on content of data contained in the report, the method comprising:
 - retrieving a data row and associated security information from a data source, the data row having data to be contained in the report;
 - determining whether data in the data row will cause a data break;
 - forming a first security tag from the security information that has been retrieved from the data source if the data row causes a data break;
 - associating the first security tag with a new page in the report wherein the data row is placed on the new page such that security is implemented at the page level for the new page in the report; and
 - placing subsequent data rows on pages having the first security tag associated therewith until a second security tag is formed such that data in the report is organized based on a plurality of security tags such that security is implemented at the page level for the pages associated with the plurality of security tags.
2. (Original) A method as recited in claim 1 wherein the report is generated from one executable component.
3. (Previously Amended) A method as recited in claim 1, wherein the security information includes one or more security identifiers, wherein forming a first security tag further comprises:
 - retrieving a security identifier for each data break from the data source wherein each data break is associated with one or more security identifiers; and
 - combining the one or more security identifiers thereby creating the first security tag.
4. (Previously Amended) A method as recited in claim 3 wherein associating the first security tag with a new page in the report further comprises:
 - associating a role adopted from a security system with a data row;
 - mapping the one or more security identifiers in the first security tag with one or more roles adopted from the security system thereby creating a security tag adaptable by the

security system; and

associating the security tag adaptable by the security system to a page in the report.

5. (Original) A method as recited in claim 4 wherein the security system has a plurality of roles and a plurality of users.
6. (Original) A method as recited in claim 4 wherein mapping security identifiers in the security tag with one or more roles further comprises:
identifying a data column in the retrieved data row upon which a data break is based;
and
identifying one or more roles in the security system that correspond to the data column.
7. (Original) A method as recited in claim 6 further comprising deriving translation rules to map the one or more roles in the security system with the data column.
8. (Previously Amended) A method as recited in claim 1 further comprising:
sorting the data from the data source based on one or more data breaks wherein a data break is caused by a change in category of the data.
9. (Original) A method as recited in claim 8 wherein a data break is a level break in the data.
10. (Original) A method as recited in claim 1 further comprising:
determining a first role in a security system that corresponds directly to the user;
determining one or more secondary roles that correspond indirectly to the user; and
combining the first role with the one or more secondary roles thereby creating a security clearance for the user.
11. (Previously Amended) A method as recited in claim 10 further comprising:
comparing the security clearance for the user with one or more of the plurality of security tags to derive a subset of pages in the report that can be viewed by the user.

12. (Currently Amended) A method of viewing a report having a security tag associated with pages in the report such that a user can only view data authorized to be shown to the user, the method comprising:

retrieving a report having a superset of pages, one or more pages from the superset of pages having a security tag associated therewith such that a plurality of security tags are associated with the superset of pages of the report;

obtaining a list of security identifiers associated with the user;

comparing the list of security identifiers associated with the user with a the plurality of security tags associated with the superset of pages of the report; and

deriving a subset of pages from the superset of pages based on the comparison such that the subset of pages only contains data that the user is authorized to view;

presenting the subset of pages as a report to the user; and

renumbering pages in the subset of pages such that the subset of pages are renumbered consecutively such that the report presented to the user appears to be complete without indicating that one or more of the superset of pages of the report are not presented to the user.

13. (Cancelled)

14. (Currently Amended) A method of viewing a report having a security tag associated with pages in the report such that a user can only view data authorized to be shown to the user, the method comprising:

retrieving a report having a superset of pages, one or more pages from the superset of pages having a security tag associated therewith such that a plurality of security tags are associated with the superset of pages of the report;

obtaining a list of security identifiers associated with the user;

comparing the list of security identifiers associated with the user with a the plurality of security tags associated with the superset of pages of the report;

deriving a subset of pages from the superset of pages based on the comparison such that the subset of pages only contains data that the user is authorized to view;

presenting the subset of pages as a report to the user; and

~~A method as recited in claim 13 further comprising renumbering pages in the subset of pages~~

such that the first page in the subset of pages is page one and subsequent pages are renumbered consecutively such that the report presented to the user appears to be complete without indicating that one or more of the superset of pages of the report are not presented to the user.

15. (Original) A method as recited in claim 14 wherein renumbering pages in the subset of pages further comprises:

creating a first page map having a first plurality of complete cells for the superset of pages wherein a complete cell represents a page;

determining whether a cell from the first plurality of complete cells represents a page the user is authorized to view; and

creating a second page map having a second plurality of partial cells wherein a partial cell represents a viewable page.

16. (Previously Amended) A method as recited in claim 15 wherein creating a first page map further comprises:

B1 comparing the list of security identifiers associated with the user with a the plurality of security tags associated with the superset or pages of the report; and

associating a value with each one of the first plurality of complete cells based on whether the user can view a particular page.

17 (Previously Amended) A method as recited in claim 15 wherein determining whether a cell from the first plurality of complete cells represents a page further comprises:

examining the content of one of the first plurality of complete cells.

18. (Original) A method as recited in claim 15 wherein creating a second page map further comprises:

creating a partial page map cell that corresponds to a complete cell representing a page in the report; and

inserting a first page map index value corresponding to the complete cell into the partial cell.

19. (Original) A method as recited in claim 15 further comprising:

inserting a second page map index value into a complete cell corresponding to a particular page the user is authorized to view.

20. (Previously Amended) A method as recited in claim 15 further comprising:
inserting a partial page number from the first page map into a page number component in a page in the report, the partial page number corresponding to a page in the superset of pages that the user is authorized to view.

21. (Currently Amended) A method as recited in claim ~~12~~ 14 wherein comparing the list of security identifiers associated with the user with the plurality of security tags associated with the superset of pages of the report comprises:

mapping one or more level break identifiers in each of the plurality of security tags with one or more security identifiers in the list of security identifiers associated with the user.

22. (Previously Amended) A method as recited in claim 21 wherein comparing the list of security identifiers further comprises comparing the level break identifiers in one of the plurality of security tags with the security identifiers in the list of security identifiers associated with the user.

23. (Currently Amended) A method as recited in claim ~~12~~ 14 wherein the list of security identifiers is derived from a security system.

24. (Currently Amended) A method as recited in claim ~~12~~ 14 wherein deriving a subset of pages from the superset of pages further comprises:

determining a commonality between one of the plurality of security tags associated with the superset of pages of the report and the list of security identifiers associated with the user; and

including a page of the superset of pages in the subset of pages if the one of the plurality of security tags and the list of security identifiers associated with the user pass the threshold level of commonality when compared.

25. (Previously Amended) A method as recited in claim 24 wherein the threshold level of commonality is having one term in the one of the plurality of security tags and the list

of security identifiers in common.

26. (Currently Amended) A method as recited in claim ~~12~~ 14 further comprising deriving content information including page numbers related to the subset of pages.

27. (Previously Amended) A method as recited in claim 26 wherein the content information only contains information related to the subset of pages and generally reflects a level break structure of the subset of pages, wherein each of the plurality of security tags is associated with a level break.

28. (Previously Amended) A computer-readable medium containing programmed instructions arranged to generate a report having security based on content of data contained in the report in a computer system, the computer-readable medium including programmed instructions for:

retrieving a data row and associated security information from a data source, the data row having data to be contained in the report;

determining whether data in the data row will cause a data break;

forming a first security tag from the security information that has been retrieved from the data source if the data row causes a data break;

associating the first security tag with a new page in the report wherein the data row is placed on the new page such that security is implemented at the page level for the new page in the report; and

placing subsequent data rows on pages having the first security tag associated therewith until a second security tag is formed such that data in the report is organized based on a plurality of security tags such that security is implemented at the page level for the pages associated with the plurality of security tags.

29. (Previously Amended) A computer-readable medium as recited in claim 28, wherein the security information includes one or more security identifiers, wherein the programmed instructions for forming a first security tag further comprises programmed instructions for:

retrieving a security identifier for each data break from the data source wherein each

data break is associated with one or more security identifiers; and
combining the one or more security identifiers thereby creating the first security tag.

30. (Previously Amended) A computer-readable medium as recited in claim 28, wherein the programmed instructions for associating the first security tag with a new page in the report further comprises:

associating a role adopted from a security system with a data row;
mapping the one or more security identifiers in the first security tag with one or more roles adopted from the security system thereby creating a security tag adaptable by the security system; and
associating the security tag adaptable by the security system to a page in the report.

31. (Original) A computer-readable medium as recited in claim 28, wherein the programmed instructions for mapping security identifiers in the security tag with one or more roles further comprises:

BI identifying a data column in the retrieved data row upon which a data break is based;
and
identifying one or more roles in the security system that correspond to the data column.

32. (Currently Amended) A computer-readable medium containing programmed instructions arranged to view a report having a security tag associated with pages in the report such that a user can only view data authorized to be shown to the user, the computer-readable medium including programmed instructions for:

retrieving a report having a superset of pages, one or more pages from the superset of pages having a security tag associated therewith such that a plurality of security tags are associated with the superset of pages of the report;

obtaining a list of security identifiers associated with the user;
comparing the list of security identifiers associated with the user with a the plurality of security tags associated with the superset of pages of the report; and

deriving a subset of pages from the superset of pages based on the comparison such that the subset of pages only contains data that the user is authorized to view;

presenting the subset of pages as a report to the user; and
renumbering pages in the subset of pages such that the subset of pages are
renumbered consecutively such that the report presented to the user appears to be complete
without indicating that one or more of the superset of pages of the report are not presented to
the user.

33. (Original) A computer-readable medium as recited in claim 32, wherein the programmed instructions for renumbering pages in the subset of pages further comprises:
creating a first page map having a first plurality of complete cells for the superset of pages wherein a complete cell represents a page;
determining whether a cell from the first plurality of complete cells represents a page the user is authorized to view; and
creating a second page map having a second plurality of partial cells wherein a partial cell represents a viewable page.

34. (Previously Amended) A computer-readable medium as recited in claim 32, wherein the programmed instructions for creating a first page map further comprises:
comparing the list of security identifiers associated with the user with a the plurality of security tags associated with the superset or pages of the report; and
associating a value with each one of the first plurality of complete cells based on whether the user can view a particular page.

35. (Previously Added) A method as recited in claim 1, wherein a data break is a level break in the data.

36. (Previously Added) A method as recited in claim 1, wherein the security information comprises one or more database fields.

37. (Previously Added) A method as recited in claim 1, wherein the security information comprises information indicating one or more levels of access to the data.
